How do I install a photovoltaic system?

Follow along with the essential steps of photovoltaic systems installation, from mounting solar modules and connecting to the grid, to commissioning and regular maintenance for optimal performance.

What is a gas insulated bus duct?

The gas insulated bus duct is used within the GIS bay to interconnect the bus duct from bay to bay or to connect external connections from the GIS bay to overhead lines and transformers. There are two principles of bus ducts: a passive and an active type.

How do you connect a single-phase insulated bus duct to an overhead line?

Figure 6 - Single-phase insulated bus duct to connect overhead lines with wall passing To connect a single-phase bus duct to an overhead line an SF6 gas-to-air bushing is used. At the extended distance between phases the bushings are then directly connected to the wires of the overhead line.

What is the voltage level of a insulated bus duct?

The installation is inside a substation to cross existing lines. The voltage level is 145 kV. In Figure 28 a single-phase insulated bus duct two-phase loop test circuit shows a vertical angle element. The voltage level is 400 kV.
