How can energy storage improve grid access?

To further improve grid access, Energy Storage Europe Association calls for: Milestone-based progress tracking and a use-it-or-lose-it principle to clear inactive projects from the queue. Greater flexibility for energy storage assets and simplified modification processes for existing connections when capacity doesn't increase.

What are the different storage requirements for grid services?

Examples of the different storage requirements for grid services include: Ancillary Services - including load following, operational reserve, frequency regulation, and 15 minutes fast response. Relieving congestion and constraints: short-duration (power application, stability) and long-duration (energy application, relieve thermal loading).

How can energy storage Europe Association improve grid access?

Energy Storage Europe Association supports transitioning from a "first-come, first-served" approach to a "first-ready, first-served" model, prioritising projects based on objective maturity criteria like land rights, permits, and financial closure. To further improve grid access, Energy Storage Europe Association calls for:

What standards are required for energy storage devices?

Coordinated, consistent, interconnection standards, communication standards, and implementation guidelines are required for energy storage devices (ES), power electronics connected distributed energy resources (DER), hybrid generation-storage systems (ES-DER), and plug-in electric vehicles (PEV).
