Overview Applications History Declining costs and exponential capacity growth Theory Efficiency Materials Research in solar cells A solar cell, also known as a photovoltaic cell (PV cell), is an electronic device that converts the energy of light directly into electricity by using the photovoltaic effect. It is a type of photoelectric cell, a device whose electrical characteristics (such as current, voltage, or resistance) vary when it is exposed to light. Individual solar cell devices are often the electrical building blocks of photovoltaic modules, known colloquially as "sol...

Arrays of solar cells are used to make solar modules that generate a usable amount of direct current (DC) from sunlight. Strings of solar modules create a solar array to generate solar power using solar energy, many ...

These cells are the fundamental building blocks of solar panels. They are typically made of semiconductor materials, such as silicon, which is excellent at absorbing sunlight and generating electricity.

Solar cells use sunlight to produce electricity. But is the "solar revolution" upon us? Learn all about solar cells, silicon solar cells and solar power.

The efficiency of a PV cell is simply the amount of electrical power coming out of the cell compared to the energy from the light shining on it, which indicates how effective the cell is at converting energy from one ...

When photons strike a PV cell, they will reflect off the cell, pass through the cell, or be absorbed by the semiconductor material. Only the photons that are absorbed provide energy to generate electricity.

Solar PV systems generate electricity by absorbing sunlight and using that light energy to create an electrical current. There are many photovoltaic cells within a single solar module, and the current created ...

Unlike batteries or fuel cells, solar cells do not utilize chemical reactions or require fuel to produce electric power, and, unlike electric generators, they do not have any moving parts.

Solar panel cell power

Just like the cells in a battery, the cells in a solar panel are designed to generate electricity; but where a battery's cells make electricity from chemicals, a solar panel's cells generate power by capturing ...

Solar PV systems generate electricity by absorbing sunlight and ...

Find out how solar cells power a good portion of homes today--and how they might power almost everything in the future.

Solar cells are thin semiconductor devices composed of layers of material -- usually silicon -- and conductive metal contacts. These cells convert sunlight into electricity through a process known as the ...
