How many volts does a solar panel produce?

Here is the setup of a solar panel: Every solar panel is comprised of PV cells, connected in series. Most common solar panels include 32 cells, 36 cells, 48 cells, 60 cells, 72 cells, or 96 cells. Each PV cell produces anywhere between 0.5V and 0.6V, according to Wikipedia; this is known as Open-Circuit Voltage or V_{OC} for short.

What is a typical open circuit voltage of a solar panel?

To be more accurate, a typical open circuit voltage of a solar cell is 0.58 volts (at 77°F or 25°C). All the PV cells in all solar panels have the same 0.58V voltage. Because we connect them in series, the total output voltage is the sum of the voltages of individual PV cells. Within the solar panel, the PV cells are wired in series.

How to calculate solar panel output voltage?

If you know the number of PV cells in a solar panel, you can, by using 0.58V per PV cell voltage, calculate the total solar panel output voltage for a 36-cell panel, for example. You only need to sum up all the voltages of the individual photovoltaic cells (since they are wired in series, instead of wires in parallel). Here is this calculation:

How many solar cells are in a solar panel?

Solar PV cells are interconnected electrically in series and parallel connections within a panel (module) to produce the desired output voltage and/or current values for that panel. Typically, solar PV panels consist of 36, or 60, or 72 interconnected solar cells.
