What are photovoltaic cells?

Photovoltaic cells, integrated into solar panels, allow electricity to be generated by harnessing the sunlight. These panels are installed on roofs, building surfaces, and land, providing energy to both homes and industries and even large installations, such as a large-scale solar power plant.

How do photovoltaic solar panels generate electricity?

An electric current is created when enough electrons are stimulated. Depending on the material, the frequency necessary to trigger the effect can vary. In photovoltaic solar panels, semiconductors are the photoelectric medium used to convert sunlight to electricity.

How does solar energy work?

The amount of sunlight that strikes the earth's surface in an hour and a half is enough to handle the entire world's energy consumption for a full year. Solar technologies convert sunlight into electrical energy either through photovoltaic (PV) panels or through mirrors that concentrate solar radiation.

How do solar photovoltaic cells convert sunlight to electricity?

Solar photovoltaic cells are grouped in panels, and panels can be grouped into arrays of different sizes to power water pumps, power individual homes, or provide utility-scale electricity generation. The efficiency that PV cells convert sunlight to electricity varies by the type of semiconductor material and PV cell technology.
