In this blog, we will discuss solar vegetation management services for maximizing production and explore our best practices.

Instead of leaving the surface uncovered, or using gravel and turfgrasses, cool-season forages can be used to offer several environmental and economic benefits. Regardless of the ...

Finally, analyses show that forage quality improves under the panels: it is richer in nitrogen and minerals, and therefore more digestible for livestock, particularly in summer.

The benefits of growing this mix however, is that it is environmentally friendly and produces a pleasant and tidy green grass which helps mitigate the visual impact of solar panels.

Studies have also shown that planting pollinator-friendly ground cover can reduce average on-site temperatures, increasing module efficiency and system production.

Whether working on a community solar garden or 1GW solar array, choosing the right vegetation can mitigate visibility concerns with adjacent landowners, reduce long-term maintenance, ...

While low-profile or robotic mowers can mow grass at solar farms, this will require higher maintenance. A low-growing grass type that can be weed-whacked (or grazed by animals) is therefore a good ...

You've probably seen those vast solar farms stretching across fields - but have you ever wondered what's happening beneath those gleaming panels? Well, it turns out the choice of turf ...

Intentional use of targeted plant species will enhance the positive impacts of a solar array for pollinators. When pollinator habitat is a primary goal, planning for these goals in the pre ...

What kind of lawn is best to plant under photovoltaic panels

Solar Farm Seed Mixes, thoughtfully designed with native plant species, are becoming the preferred choice for solar operators. With a clear understanding of vegetation, cover crops and a well-designed ...
